

WARNING to Michigan Sportspersons

Methamphetamine is a growing concern in Michigan. It should be of particular concern to unsuspecting outdoor enthusiasts who may stumble across discarded methamphetamine cooking components or even worse, meth cookers.

Meth labs are commonly found in secluded rural areas. Exposure to chemicals used in meth production can cause severe health problems, including respiratory problems, skin and eye irritation, headaches, nausea and dizziness.

In addition, meth cookers can display extreme paranoia, resulting in violent encounters.

- If you stumble across methamphetamine components do not touch them.
- If you encounter a meth cooker do not engage them. Retreat and call 911.
- If you witness suspicious activities, call 911 or the Michigan Meth Tip Line:
